

Electricity from Water Vapor

[BlackLight Power](#)

In six separate, independent studies, leading scientists from academia and industry, with PhDs from prestigious universities including the Massachusetts Institute of Technology and the California Institute of Technology, confirm that BlackLight has achieved a technological breakthrough with its CIHT (Catalyst-Induced-Hydrino-Transition) clean energy generating process and cell. The Process is fueled by water vapor that is a gaseous component of air and present wherever there is any source of water. The CIHT cell harnesses this energy as electrical power output and is suitable for essentially all power applications including transportation applications and electrical power production completely autonomous of fuels and grid infrastructure at a small fraction of the current capital costs.

http://pesn.com/2012/05/22/9602098_Electricity_generated_from_water--BlackLight_Power_announces_validation/

BlackLight has achieved a proprietary breakthrough power-producing system continuously operating that converts [ubiquitous](#) H₂O vapor directly into electricity as confirmed by six separate independent individual or groups of leading scientists from academia and industry with Ph.D.s from prestigious universities including the Massachusetts Institute of Technology and the California Institute of Technology.

Specifically, BlackLight has developed a commercially competitive, nonpolluting source of energy that forms a predicted, previously undiscovered, more stable form of hydrogen called "Hydrino" that releases two hundred times more energy than [burning hydrogen](#) enabling [ubiquitous](#) H₂O vapor to serve as the source of H₂ fuel.
