

# Letter to Werner Zimmermann

**Letter to Werner Zimmermann. June 20th 1936**

From Spec. Ed. *Mensch und Technik*, Vol. 2, 1993, section 7.4.

Read "The Ox and the Chamois"[1] again. There you will find precisely the **opposite preconditions**, namely the **release of energy** through **cold**. Here **heat**

88

is first **generated** through **friction**. This **heat** is immediately **absorbed** by the **water** and in the **process** a physical **vacuum** is created, which then gives rise to the **emergence** of **inner-atomic rays**. Due to the **absorbed heat**, the **free, dissolved oxygen** still present in the **water** becomes **aggressive** and the **emergent geospheric rays** become **aggressive** owing to the presence of the **vacuum**. Through the encounter between the **mutually opposed, contra-directionally propagated, excited rays**, the **precondition** for the **marriage** is created. The **child** of this **union** is **organic**, or **cold light**.

Good **seed** in good **earth** produces a **multiple** of itself in **fruit**. The **seed grows** and its **multiplication proceeds** with the aid of **contra-directional influences**. These **influences** are **higher forms** of **organisation** stemming from the **Earth** and the **Cosmos**. **Substances** that are **ripe** must either **fall upwards** or **downwards**. When **water** is **decomposed inner-atomically**, then what finally remains is the **substance - water**, the **H-substance**[2]. This **H-substance** is the **polarity**, which **strengthens** itself through these **influences**. It is the **ur-child** that draws in **essences** and **energies** from **above** and **below** and in this way it **grows**.

The **plus** and **minus elements dissociated** from the **water separate** from one another. The small **quantities** of **carbone** present in poor **quality water** make their **escape** immediately, because they **dematerialise** themselves. The **phos-elements**[3] **incorporated** by the **Sun disperse**, enter the **horizontal potential field**, become highly **aggressive**, spread themselves over the **active substances** and await things now **imminent**. The '**imminent**' is a **geospheric gas**, which is **ingested** with great **cold**.

With sudden **cooling**, **carbones** become highly **aggressive**. A **marriage** between the highly **aggressive phos-elements** and the equally **aggressive C** now takes place. The **super-potentiated geospheric gas product** evolving from this **union binds** the **hydrogen** through the **emergent inner vacuum** and **rising** rapidly, **cools** off and lands on an **organic anode**, whose **upper section** is extended into a **cathode**.

By means of **mechanical diffusion** this **transmitter generates** a **horizontal potential field** and rapidly **cools** the **gas mixture**. Having become highly

[1] See "The Ox and the Chamois" in *Nature as Teacher*, p.41, Vol. II of the *Ecotechnology series*. — Ed.

[2] **H-substance**: here refers to **hydrogen** or **hydrogen-like substances**. — Ed.

[3] **Phos-elements**: It is not quite clear what is intended here, but it may relate in some way to **bioluminescence**. However, the following three definitions are provided as an aid to interpretation.

**PHOSPHOR**: A **substance** which is capable of **luminescence**, i.e. storing **energy** (particularly from **ionising radiation**) and later releasing it in the form of **light**. If the **energy** is released after only a short delay (between 10<sup>-10</sup> and 10<sup>-4</sup> seconds) the **substance** is called a '**scintillator**'.

**PHOSPHORUS**: P. Element. **Atomic weight** 30.9738. **Atomic number** 15. Occurs in several **allotropic forms**, white phosphorus and red phosphorus being the commonest. The former is a waxy white, very inflammable and poisonous solid. Red phosphorus is a non-poisonous, dark red powder, not very inflammable. The element only occurs in the combined state, mainly as **calcium phosphate**,  $\text{Ca}_3(\text{PO}_4)_2$ , Essential to **life**; **calcium phosphate** is the main constituent of animal **bones**.

**PHOSPHATE**: Salt of phosphoric acid  $\text{H}_3\text{PO}_4$ . Phosphates are used as **fertilisers** to rectify a deficiency of **phosphorus** in the **soil**. Note: The editor regrets that he cannot locate the dictionary from which the information was originally sourced.'

89

aggressive again, as soon as it is expressed this gas will be hungrily absorbed by the surrounding atmospheric oxygen. This O has H and C in tow, which have been drawn along with it due to centripetence. What is important here, is whether this process is permitted to proceed, 1. via warm, or 2., via cold oxidation.

In the first case a surplus of water is produced. In the second case a surplus of air results. In both cases, however, both products have evolved and grown, and hence the product of growth is a multiple of the original seed-form. The better the earth, the stronger the growth and the greater the abundance of the substance.

If air is produced, then water is in the minority. The increase in this case is the air mixture and the 4th dimension that emerges from it - motion as matter. Out of this motion the 5th dimension ultimately comes into being, i.e. the radiant product, the spirit. This spirit can materialise itself. Conversely, a solid, liquid or gaseous substance can of course be spiritualised as well. Whether one desires to produce one or the other intermediate product is merely a question of the dosing of the intermediate process. The dosing of either heat or cold. The organ that comes into being either in this way or the other is a result of the organisation.

Every organ is an aid or a means to an end that requires various supplementary energies in order to evolve. In its highest form, the developed product is a multiple of the ur-form, because the potencies in it have developed themselves. Potencies are nothing more than bipolar tensions, which de-stress one another and synthesise their desired form. This is the reason for the phenomenon of multiplication. The function of tensioning or de-stressing is heat and cold. The product is therefore a product of heat or cold. The impulse is produced by either a cold or warm mediatory process. The place of birth is the egg and the orifice. The fertilised eggs create orifices and conversely, eggs come into being from orifices.

Radiation is the bipolar unity, the ur-information, which metamorphoses itself into proteins. Since information is also bipolar, then the space, the irtter-space and the shell come into being in this way. The energy evolving within the shell is space-energy, which like everything else is also bipolar. The heat-potential gives birth to the form and the cold-potential gives rise to dematerialisation. The latter is elemental motion and the former is the elemental envelope, that is, the multiplied soul and the multiplied body.
