

# fabricate

## Schauburger

We shall now address what is encompassed by the title of this article. Rather than present a long and detailed [description](#) or [explanation](#), the only proper course of [action](#) would simply be to [demonstrate](#) the new [source](#) of [energy](#), as most people would suggest. Certainly that would be the right thing to do. However, various reasons argue against this, which should and must be taken into account. Firstly, in the present times [immediately post-WW II] it is not at all easy to obtain the necessary [materials](#), suitable skilled labour, machines, etc., all of which are required to **fabricate** these [bio-machines](#). Moreover, and understandably so, a justifiable disbelief also prevails when such [Utopian](#) things are to be produced and also have to be explained in order to begin the laborious [creation](#) of a first [prototype](#), because today nobody can be motivated to [work](#) on frivolities. Over the last few years extremely hard [work](#) was done under almost impossible conditions and the most extraordinary results achieved, all of which seemed ordained to arouse a zest for further [work](#). However, the desire to [work](#) is by no means overwhelming and entirely justifiable [suspicion](#) is everywhere. This is compounded by the fact that in spite of all the [curiosity](#), nobody wants to be [ridiculed](#) for being taken for a ride by a supposed [visionary](#).
