

omnipresent universe

"The [principle of electronics](#) is a miniature example of what [electricity](#) does in a [vacuum](#). A [vacuum tube](#), with no [electricity](#) dividing it, is the normal [rest](#) condition of the universe. See [Fig. 6](#). [Electricity](#) emerges from the **omnipresent universe** and disappears into it, as [light](#) appears and disappears in a [vacuum tube](#). [Electricity](#) ceases to be [electricity](#) when it loses its power to move. When we speak of [electric expansion](#) it is in the sense that it is weakening, just as we say of a man who still lives, that he is dying. [Electricity](#) does not expand, nor is there a kind of [electricity](#) which does expand. It merely weakens by becoming lower in [potential](#) and [speed](#)." [Atomic Suicide, page 149]
