

triboluminescence

Schauburger

[29] This refers to **triboluminescence**, which is the energy, expressed as light, given off by electrons returning to their rest-orbits after having been excited due to the pressure arising when stones are rubbed together. This emission of energy is a net gain to the overall energy-content of water. [See [The Water Wizard](#), "Fire under Water". - Ed.]

Demonstration of this effect using quartz: <https://www.facebook.com/reel/2309890426042942>
